

# **Current Transducer IN 2000-SB**

# *I*<sub>ΡN</sub> **= 2000 A**

For the electronic measurement of current: DC, AC, pulsed..., with galvanic separation between the primary and the secondary circuit.

## **Features**

- Specified ±10 V voltage output
- Closed loop (compensated) current transducer using an extremely accurate zero flux detector
- 9-pin D-Sub male secondary connector
- Status signal to indicate the transducer state
- · LED indicator confirms normal operation
- Metal housing to improve immunity to EMC & power dissipation
- Operating temperature -40 °C to 85 °C.

## **Advantages**

- Very high accuracy
- Excellent linearity
- Extremely low temperature drift
- Wide frequency bandwidth
- High immunity to external fields
- No insertion losses
- Low noise on output signal
- Low noise feedback to primary conductor.

## **Applications**

- Feedback element in high performance gradient amplifiers for MRI
- Feedback element in high precision, high-stability power supplies
- Calibration unit
- Energy measurement
- Medical equipment.

## **Standards**

- EN 61000-6-2: 2005
- EN 61000-6-3: 2007
- EN 61010-1: 2010.

## **Application Domain**

- Industrial
- Laboratory
- Medical.

Start-up time	t <sub>start</sub>	s	2	5	15			

Notes: <sup>1)</sup> Single pulse only, not AC. The transducer may require a few seconds to return to

normal operation when autoreset system is running.

 $^{\rm 2)}\,$  All ppm figures refer to full-scale which corresponds to a secondary nominal voltage of  $I_{\rm P\,N}$ 

## **Overload protection - Electrical specification - Status**

The overload occurs when the primary current  $I_p$  exceeds a trip level such that the fluxgate detector becomes completely saturated and, consequently, the transducer will switch from normal operation to overload mode.

This trip level is guaranteed to be greater than  $I_{PM}$  and its actual value depends on operating conditions such as temperature and measuring resistance.

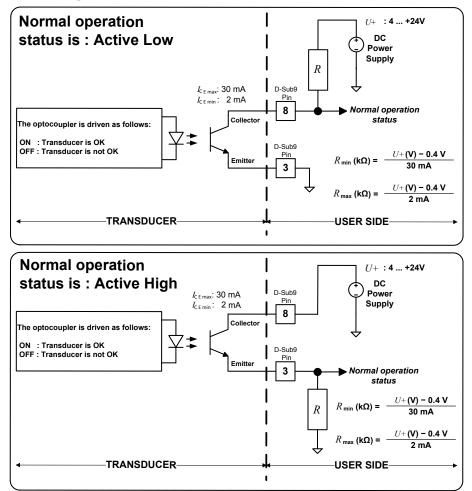

When this happens, the transducer will automatically begin to sweep in order to lock on the primary current again.

The overload conditions will be:

- The secondary current  $I_s$  generated is a low frequency signal.
- The signal normal operation status (between pin 3 and 8 of the D-sub connector) switches to U+ or ≈ 0.7 V. See the status port wiring below.
- The green LED indicator (normal operation status) turns off.

The measuring can resume when the primary current returns in the measuring range between  $-I_{PN}$  and  $+I_{PN}$ . Then the signal normal operation status switches to GND and the green LED indicator (normal operation status) switches on.

#### Status/Interlock port wiring

The following table shows how the normal operation status acts as below:

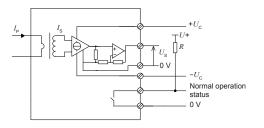

Status	Value	Description
Active Low ≈ 0.7 V		The transducer is OK (Normal operation)
Active Low	U+	The transducer is not OK (Overload mode or supply fault)
Active High	U+	The transducer is OK (Normal operation)
Active High	≈ 0.7 V	The transducer is not OK (Overload mode or supply fault)
		Dama 4/7

# Performance parameters definition

The schematic used to measure all electrical parameters is shown below:

## **Transducer simplified model**

The static model of the transducer at temperature  $T_{\rm A}$  is:

$$U_{\rm S} = S \cdot I_{\rm P} + \varepsilon$$

In which

$$\varepsilon = U_{\text{OF}} \text{ at } 25 \text{ °C} + U_{\text{OT}} (T_{\text{A}}) + \varepsilon_{\text{L}} \cdot I_{\text{PM}} \cdot S$$

Where,

$$U_{\mathsf{O}T}(T_{\mathsf{A}}) = TCU_{\mathsf{O}E} \cdot |T_{\mathsf{A}} - 25 \ ^{\circ}\mathsf{C}| \cdot I_{\mathsf{P}M} \cdot S$$

Us S	: secondary voltage (V)
S	: Sensitivity (V/A)
$I_{P}$	: primary current (A)
I <sub>PM</sub>	: primary current, measuring range (A)
T <sub>A</sub>	: ambient operating temperature (°C)
Û <sub>oe</sub>	: electrical offset voltage (V)
$U_{0T}$	: temperature variation of $U_{OE}$ at $T_{A}(V)$
<i>Е</i> ,	: linearity error

This is the absolute maximum error. As all errors are independent, a more realistic way to calculate the error would be to use the following formula:

$$\varepsilon = \sqrt{\sum_{i=1}^{N} \varepsilon_i^2}$$

### Linearity

To measure linearity, the primary current (DC) is cycled from 0 to  $I_{\rm P\,M}$ , then to  $-I_{\rm P\,M}$  and back to 0. The linearity error  $\varepsilon_{\rm L}$  is the maximum positive or negative difference between the measured points and the linear regression line, expressed in parts per million (ppm) of full-scale which corresponds to the maximum measured value.

#### **Electrical offset**

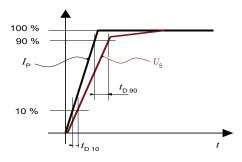

The electrical offset voltage  $U_{\rm OE}$  is the residual output voltage when the input current is zero.

The temperature variation  $U_{0\,T}$  of the electrical offset voltage  $U_{0\,E}$  is the variation of the electrical offset from 25 °C to the considered temperature.

#### Delay times

The delay time  $t_{\rm D\ 10}$  and the delay time  $t_{\rm D\ 90}$  are shown in the figure below.

Both slightly depend on the primary current  $d_i/d_t$ . They are measured at nominal current.

 $t_{\rm D\,10}$  (delay time @ 10 %) and  $t_{\rm D\,90}$  (delay time @ 90 %)

## Safety

This transducer must be used in limited-energy secondary circuits according to IEC 61010-1.

This transducer must be used in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer's operating instructions.

Caution, risk of electrical shock

When operating the transducer, certain parts of the module can carry hazardous voltage (e.g. primary busbar, power supply). Ignoring this warning can lead to injury and/or cause serious damage.

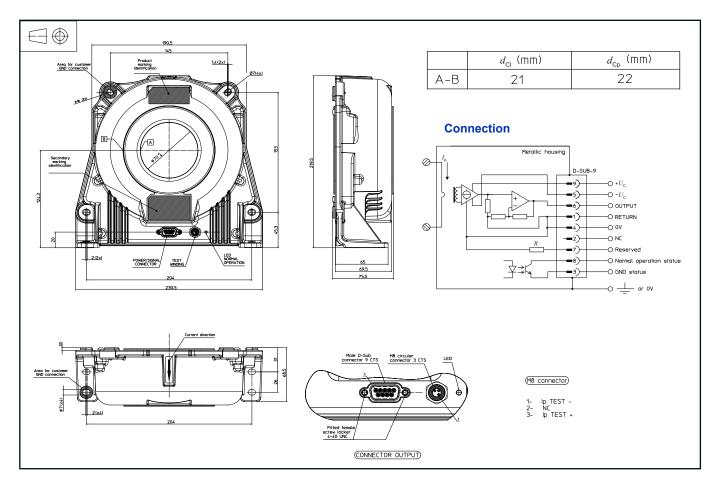

This transducer is a build-in device, whose conducting parts must be inaccessible after installation.

A protective housing or additional shield could be used. Main supply must be able to be disconnected.

# Dimensions (in mm)

IN 2000-SB

## Connection

- Normal operation status (Pins 3 and 8) Normal operation means:
  - ±15 V (± $U_{\rm c}$ ) present
  - 0 V on D-Sub has to be tied
  - zero detector is working
  - compensation current  $\leq I_{PMDC}$
  - green LED indicator switches on.

## **Mechanical characteristics**

	General tolerance Transducer fastening	±0.75 mm
	- Horizontal mounting	4 holes Ø 7 mm
	and vertical	with 2 slots gap along
		transducer
		4 M6 steel screws
	Recommended fastening torque	5.5 N·m
•	Connection of secondary	on D-SUB-9,
		UNC 4-40

otherwise specified on the datasheet, according to LEM Transducer Generic Mounting Rules. Please refer to LEM document N°ANE120504 available on our Web site: https://www.lem.com/en/file/3137/download.

Installation of the transducer must be done unless

• All mounting recommendations are given for a standard mounting. Screws with flat and spring washers.

### Remarks

- $U_{\rm s}$  is positive when  $I_{\rm p}$  flows in the direction of the arrow.
- We recommend that a shielded output cable and plug are used to ensure the maximum immunity against electrostatic fields.
- Temperature of the primary conductor should not exceed 100 °C.
- We recommend to fix the potential of the housing to the ground.
