Temperature rise	<b>30°C</b> Max. Change allowed	<ol style="list-style-type: none"> <li>Mate connector: measure the temperature rise at rated current after: <b>1.5 A minimum</b> Power contact.</li> <li>The temperature rise above ambient shall not exceed 30°C The ambient condition is still air at 25°C</li> <li>Wire power pins P1, P2, P8 and P9 in parallel for power</li> <li>Wire ground pins P4, P5, P6, P10 and P12 in parallel for return</li> <li>Supply 6A total DC current to the power pins in parallel, returning from the parallel ground pins (P4, P5, P6, P10 and P12)</li> </ol>

**NOTES**

- Time domain measurement equipment allows for delay adjustment of the pulses so launch times can be synchronized. Frequency domain equipment will require the use of phase-matched fixturing. The fixturing skew should be verified to be < 1ps on a TDR.
- The system rise time is to be set via equipment filtering techniques. The filter risetime is significantly close to stimulus risetime. Therefore the filter programmed equals the square root of  $(t_{r(\text{observed})})^2 - (t_{r(\text{stimulus})})^2$ . After filtering, verify the risetime is achieved using the risetime reference traces on the PCB fixture.
- Calibrate the system by substituting either precision 50-ohm loads or precision air lines (also terminated in 50 ohm loads) for the test fixture. This places the calibration plane directly at the input interface of the test fixture.
